

Forecasting the Price of Polypropylene

Commodity	Polypropylene Homopolymer Rafia (FD UK)
Forecast Period	September 2017 – February 2018
Currency	£
Unit	Metric Tonne
Observations	Monthly forecasts of the spot price in the first day of the month

Forecasts

Month/Year	Forecast	Prob. of Raise
Sep. 2017	1124£	55 %
Oct. 2017	1086£	47 %
Nov. 2017	1155£	50 %
Dec. 2017	1189£	51 %
Jan. 2018	1220£	73 %
Feb. 2018	1226£	59 %

Suggested Action for Procurement

Purchase Limit Month	Suggested Action
September 2017	Buy in August at 1110£
October 2017	Buy part of requirements
November 2017	Buy part of requirements
December 2017	Buy part of requirements
January 2018	Buy part of requirements
February 2018	Buy part of requirements

Forecasting the Price of Polypropylene

Impact Analysis: One Month Forecast

Our algorithm forecasts a higher price of PP Rafia in one month: it is expectable that the price increases 1.27% from 1110£ to 1124£ until the beginning of September.

Indices of Factors

Interpretation

- **Decrease of Supply:** Positive pressure of the Supply index
- **Increase of Demand:** Positive pressure of the Demand index
- **Considerably positive pressure of the index of PP Rafia**
- Positive pressure of the index of variables representing the market upstream
- Slightly negative pressure of the index of variables representing the market downstream
- Positive pressure of the financial index
- Positive pressure of other commodities and other factors
- Focus on Euro, Mexico, and Germany

Impact per Country

Disclaimer: This document was made for commercial purposes. All the contents of this document should be of the reader's consideration, so that none of the suggested actions represent incentives to act. Watson & Noble does not take responsibility for actions based on this document.

Forecasting the Price of Polypropylene

Impact Analysis: Two Months Forecast

Our algorithm forecasts a lower price of PP Rafia in two months: it is expectable that the price decreases 2.17% from 1110£ to 1086£ until the beginning of October.

Indices of Factors

Interpretation

- Slight increase of Supply: Negative pressure of the Supply index
- **Decrease of Demand:** Negative pressure of the Demand index
- Positive pressure of the index of PP Rafia
- Negative pressure of the index of variables representing the market upstream
- Negative pressure of the index of variables representing the market downstream
- Negative pressure of the financial index
- Negative pressure of other commodities and other factors
- Focus on China, Italy, and Mexico

Impact per Country

Forecasting the Price of Polypropylene

Impact Analysis: Three Months Forecast

Our algorithm forecasts a higher price of PP Rafia in three months: it is expectable that the price increases 4.02% from 1110£ to 1155£ until the beginning of November.

Indices of Factors

Interpretation

- **Decrease of Supply:** Positive pressure of the Supply index
- Slight increase of Demand: Positive pressure of the Demand index
- **Considerably positive pressure of the index of PP Rafia**
- Negative pressure of the index of variables representing the market upstream
- Positive pressure of the index of variables representing the market downstream
- Slightly positive pressure of the financial index
- Positive pressure of other commodities and other factors
- Focus on Belgium, China, and Mexico

Impact per Country

Forecasting the Price of Polypropylene

Impact Analysis: Four Months Forecast

Our algorithm forecasts a higher price of PP Rafia in four months: it is expectable that the price increases 7.13% from 1110£ to 1189£ until the beginning of December.

Indices of Factors

Interpretation

- **Decrease of Supply:** Positive pressure of the Supply index
- **Increase of Demand:** Positive pressure of the Demand index
- **Considerably positive pressure of the index of PP Rafia**
- **Considerably positive pressure of the index of variables representing the market upstream**
- Positive pressure of the index of variables representing the market downstream
- **Considerably positive pressure of the financial index**
- Positive pressure of other commodities and other factors
- Focus on Belgium, Japan, and Vietnam

Impact per Country

Forecasting the Price of Polypropylene

Impact Analysis: Five Months Forecast

Our algorithm forecasts a higher price of PP Rafia in five months: it is expectable that the price increases 9.94% from 1110£ to 1220£ until the beginning of January.

Indices of Factors

Interpretation

- **Considerable decrease of Supply:** Positive pressure of the Supply index
- **Considerable increase of Demand:** Positive pressure of the Demand index
- **Considerably positive pressure of the index of PP Rafia**
- **Considerably negative pressure of the index of variables representing the market upstream**
- **Considerably positive pressure of the index of variables representing the market downstream**
- **Considerably positive pressure of the financial index**
- Slightly positive pressure of other commodities and other factors
- Focus on Indonesia, Germany, and Euro

Impact per Country

Forecasting the Price of Polypropylene

Impact Analysis: Six Months Forecast

Our algorithm forecasts a higher price of PP Rafia in six months: it is expectable that the price increases 10.40% from 1110£ to 1226£ until the beginning of February.

Indices of Factors

Interpretation

- **Decrease of Supply:** Positive pressure of the Supply index
- **Increase of Demand:** Positive pressure of the Demand index
- **Considerably positive pressure of the index of PP Rafia**
- **Considerably negative pressure of the index of variables representing the market upstream**
- **Considerably positive pressure of the index of variables representing the market downstream**
- **Considerably positive pressure of the financial index**
- Slightly positive pressure of other commodities and other factors
- Focus on France, Euro, and Turkey

Impact per Country

Forecasting the Price of Polypropylene

APPENDIX – Technical Explanation of the Impact Analysis

In this appendix, we explain the impact analysis of the factors that most contribute for our forecasts.

This Impact Analysis is conducted individually for **each time horizon**, allowing for a distinction between the indices of variables that contribute for our forecasts at short and medium run.

For each time horizon, our analysis has **two components**: first, we present the impact of variables grouped by **indices of factors**; second we present the impact of variables grouped by **indices of countries**.

Indices of Factors

Indices of factors are indices of the weighted contributions of the variables grouped in those factors.

Supply Index: composed of macroeconomic variables of the producing and exporting countries. It includes variables such as production, exchange rates, inflation, monetary policy, and wages. For example, an increase in wages implies higher production costs which should (in linear, general, and ceteris paribus terms) generate an incentive to increase prices;

Demand index: composed of macroeconomic variables of the consuming and importing countries. It includes variables such as production, exchange rates, inflation, monetary policy, and wages. For example, a decrease in a consumer confidence index should (in linear, general, and ceteris paribus terms) increase savings and decrease demand, leading to lower prices;

Polypropylene Index: composed of variables related to Polypropylene. It includes variables such as the price of Polypropylene in different regions of the world and exports, imports, and producer prices of Polypropylene in some countries. For example, an increase in the price of Polypropylene in other region may imply an increase in the price of Polypropylene in Europe due to arbitrage movements;

Upstream index: composed of variables related to Propylene, Oil, Natural Gas and Naphtha. It includes variables such as the price and exports, imports, and producer prices of the inputs in some countries. For example, an increase in the price of Propylene should (in linear, general, and ceteris paribus terms) generate an increase in the price of Polypropylene;

Forecasting the Price of Polypropylene

APPENDIX – Technical Explanation of the Impact Analysis (II)

Downstream index: composed of variables related to downstream industries, such as Packaging. It includes variables such as the exports, imports, and producer prices of the Plastic Industry in some countries. For example, an increase in the demand of Plastic should (in linear, general, and ceteris paribus terms) generate an increase in the price of Polypropylene;

Financial Variables Index: composed of financial market variables. It includes the share price of companies that produce Polypropylene. It also includes financial indices related to this sector. For example, a positive change in the share price of a producer of Polypropylene should (in linear, general, and ceteris paribus terms) imply an increase in expected profitability of the firm. This may signal an expectation of increase in the price of Polypropylene;

Other Variables Index: composed of variables related to other polymers and other commodities, such as Ethylene and Benzene. It includes the price, exports, and imports of these commodities. For example, a positive change in the price of a substitute commodity, should (in linear, general, and ceteris paribus terms) imply an increase of demand of Polypropylene, and thus, of the price of Polypropylene.

Indices of Countries

Indices of Countries: are indices of the weighted contributions of the macroeconomic variables of each country. The countries we present are the most relevant countries in the production, consumption, and international commerce of Polypropylene.

Interpretation Warning

It is important to note that the contribution of individual variables and indices of variables is not linear. The interaction between variables and between variables of different factors may not be neglectable, which means that the importance of each variable and indices of variables is determined together with the importance of all other variables.

Furthermore, the analysis of changes in variables is not linear. This means that the same variable with the same change in different moments of time may have different impacts given its previous evolution. For example, the algorithm contrasts the change in a variable with its expected change. A positive change but inferior to the expected change may originate an effect of price correction.
